

### Disaster, Human Life and Global Warming.

Disasters come stronger than ever in the history. Though many experts predict there will be more and more weird disastrous phenomena in the future, the recent environmental global commission in Denmark still had no result in the end. Generally speaking, most of people believe that the global warming has a lot to do with the weird and heavy natural disaster. Due to the global warming, many governments put an eye on the environmental protection and start to take some measure to deal with the problem. For example, the Swedish government promotes the biogas to replace for the gasoline, and encourages the people to buy the biocar or the car motivated by the electricity. In the other place, the Danish government also encourages the citizens to move by the bicycle instead of car. Both of the examples want to decrease the increasing of carbon and reflect that we need to tread our planet the earth better.

The global warming will affect the speed of sea-level raising. Many island country will be drowned or lose the living space. Taiwan is also an island country too. To face the difficult problem, we have launched many practical actions. For instance, when switching the air-conditioner, we can only set the temperature of 26 degrees Celsius to avoid more production of carbon. Besides, to meet the slogan "Reduce, reuse and recycle", the people in Taiwan have to classify the garbage like the papers, the glass, common garbage and so on many recycle by the sea, therefore we lack of many natural resources and are bound to import many resources from other countries. The recycle activity can help us reuse the materials to make the products and decrease the need of mass imported resources. Now, like the Danish people, many Taiwanese people begin to ride bicycle to commute every day for to serve as a leisure activity. In the other hand, our government also promotes the bicycle-riding as a new-life activity which does good to the environment and also to the health.

For me, the recent flooding disaster in I-Lan has proved that the global warming will cause the huge disasters. I-Lan is my hometown, when I lived there in the past years, I never had any big disaster problems even the flooding news in the downtown. How terrible the flooding it is! My home was too lucky to be flooded. But in the distance of 50 meters of my home, the buildings were flooded up to 1 floor high. It is really a big alarm for me to face the environmental protection, when I came to Taipei, I didn't buy the motorcycle but take the MRT or the bus all the time. I thought the public transportation in Taipei is very convenient, I could move to anywhere by them and at the same time, I could save the fuel pollution production,

that was most important. I like to drink the beverage, when buying the beverages, they offer the paper cap to fill the beverage. But I always prepare my cup to full the beverages to decrease the paper cup using. Decreasing the using of one paper cup, we can also decrease the energetic consumption. If everyone take the action, that will be a great decreasing in the carbon production.

To sum up, our lives are related to the planet "The earth". I believed that if we keep on doing some environmental protection actions, we will decrease the loss and the graveness of natural disasters. And we can still live a better life.
