

Rescue the Environment

Since the scientists discovered the global warming issue and the hole on the ozonosphere, the authorities around the world have began promoting the conception about 3R, recycle, refuse and reduce. But do human beings abide by the rules? In my opinion, I think that there is no dramatic effect on rescuing our environment, and my reasons are as follow.

No matter how constantly the government demands people not to litter, yet it seems that no one really cares about the rule. As long as people take a walk or travel around, they might be tagged after by trash and the reason is quite clear that people keep producing wastes; therefore, people can't get rid of them. Aside from residents' poor living habits, all kinds of pollutions from the industry is another significant factor that can't be neglected. Developing countries need business in order to prosper their economies; thus, they refuse to cut down on the emission of the carbon dioxide which is truly one of the major problems.

These two reasons I've mentioned above are something vital and it's obvious enough that they are poisonous. As far as I am concerned, the government should set up more trash cans along the sidewalk because people are so indolent that they are unwilling to walk farther to throw their rubbish. Hence, if there are more trash cans, there may be fewer litters on the road. In addition to this suggestion, people ought to make good use of transportation so as to reduce the emission of the carbon dioxide. Although it has little influence on saving the earth when it compares with limiting the factories to emit carbon dioxide, yet it's better late than never.

In fact, people must take the environmental issue seriously because it not only relates to their physical condition but also has something to do with the economy. Suppose Taiwan is successfully free from pollution, it will boost Taiwan's tourism because of its fresh air, boundless ocean which is extremely clean, magnificent scenery when people overlook the scene from Mt. Jade and so on. Besides, when people get rid of pollution they have fewer chances to come down with cancer or some diseases than those who are exposed to contaminated surroundings. It's truly a benefit to save the environment, isn't it?

Rescuing the environment is never a piece of cake to all human beings, and it may take tens or hundreds of years to recover the Mother Nature; however, it is worthy of doing. It is and arduous task that people confront and without anyone of you guys, people can't make it. Therefore, people should unite into a family which sticks to the only principle, saving the environment.
